

Using the new Disposition Field

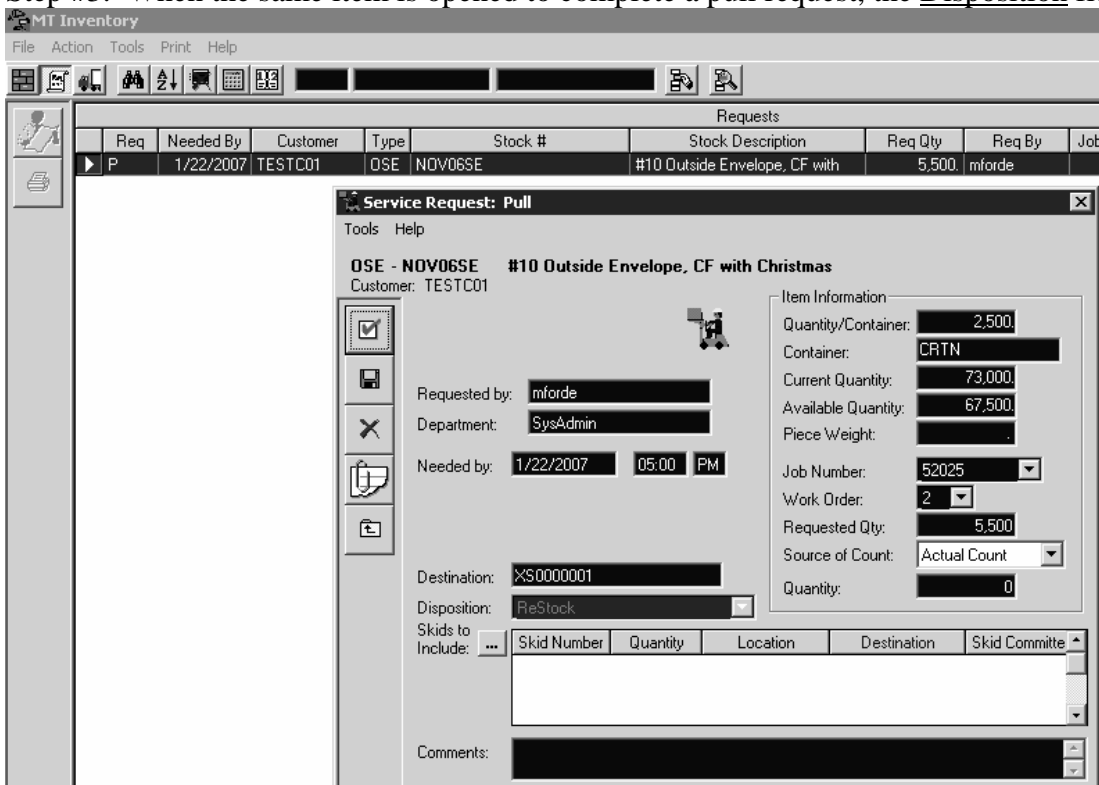

Step #1. When CSR allocates the material to a job, work order or Op code, the Disposition field is available to select and the CSR can put a note here along with their initials.

Step #2. Once allocation is “saved”, the disposition for that item appears on screen.

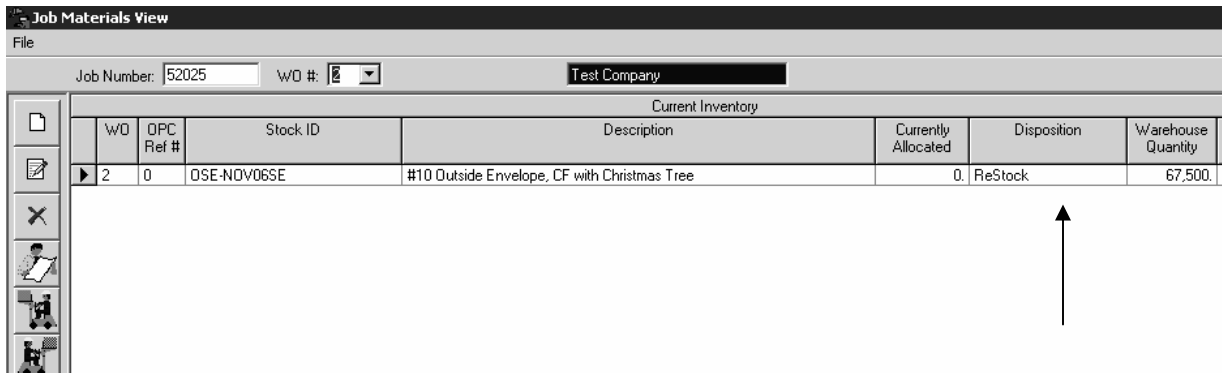

Step #3. When the same item is opened to complete a pull request, the Disposition field is blacked out.

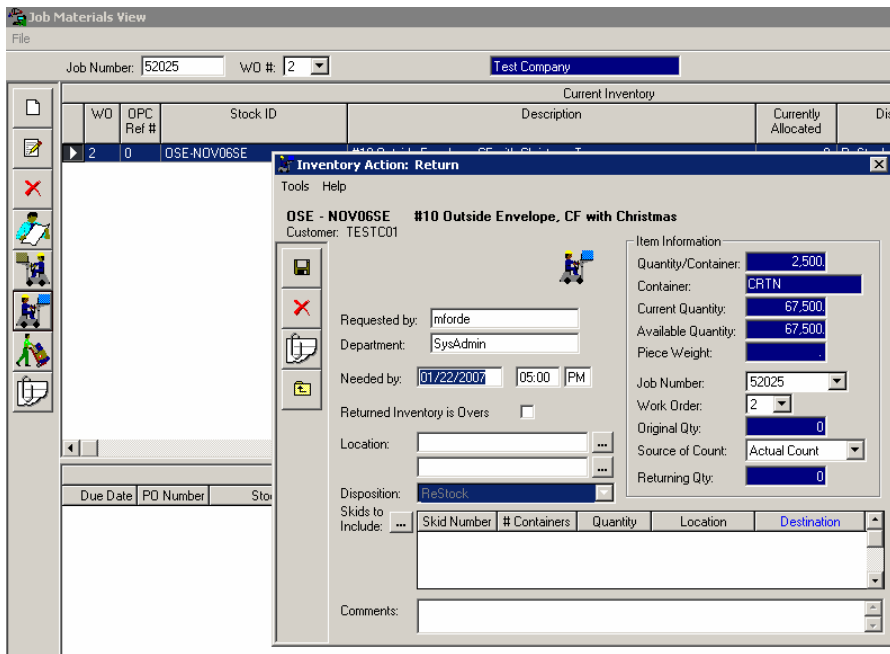

Step #4. When the warehouse staff opens the item and selects skids to be pulled, the disposition field is blacked out.

**Returning the item:**

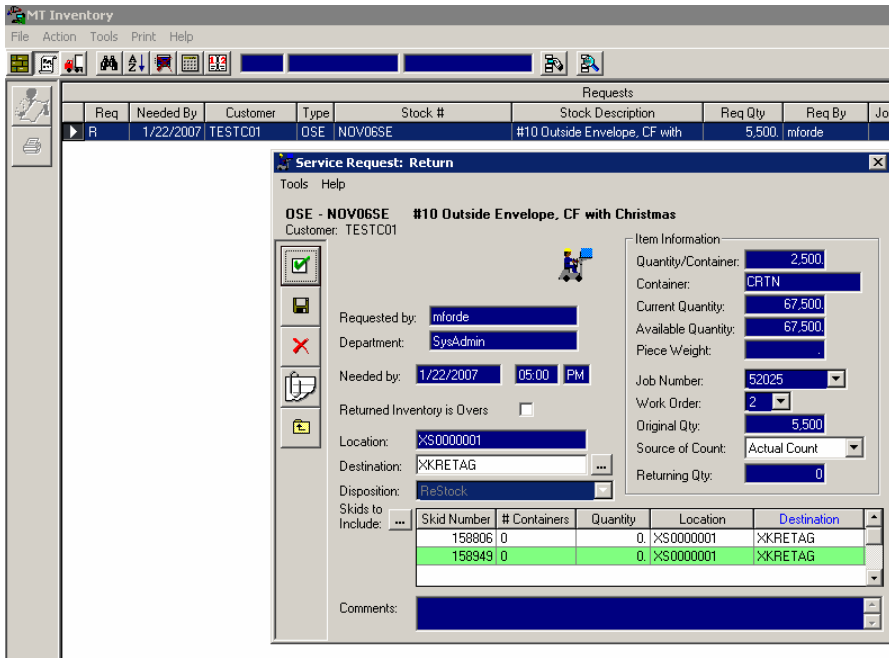

When production is complete and the item gets returned to Warehouse, the disposition field appears as follows:

Step #5: Warehouse user opens inventory and then opens the “Job Materials View” Screen. The disposition for the item can be viewed from this screen.

Step #6. The warehouse user selects the item and selects the skids to be returned, but the **disposition** field is blacked out.

Step #7. Skids are selected for the return and a destination is selected, warehouse staff saves the request, so it is moved to the request screen as an “R” transaction. Once the user closes the return, then the disposition is closed/removed also against the item so the next time it is used a new disposition can be provided.
